

d) All of the mentioned

STATISTICS WORKSHEET-3

Q1 to Q9 have only one correct answer. Choose the correct option to answer your question.

1. Which of the fo	ollowing is the correct formula for total variation?
a) T	otal Variation = Residual Variation - Regression
1 \ m . 1 x x . 1	Variation
	tion = Residual Variation + Regression Variation
c) T	otal Variation = Residual Variation * Regression
d) All of the m	Variation
u) An or the in	ichtiolied
2. Collection of ex-	changeable binary outcomes for the same covariate data are calledoutcomes.
a) random	onangeuere emary outcomes for the same covariate data are cance.
b) direct	
c) binomial	
d) none of the	mentioned
,	
3. How many outc	omes are possible with Bernoulli trial?
a) 2	•
b) 3	
c) 4	
d) None of the	mentioned
	<mark>l we reject it is called</mark>
a) Type-I erroi	
b) Type-II erro	
c) Standard err	
d) Sampling en	rror
7 I 1 C : :C	. 1 11 1
-	cance is also called:
a) Power of the	
b) Size of the to c) Level of con	
d) Confidence	
a) Confidence	Coefficient
6. The chance of re	ejecting a true hypothesis decreases when sample size is:
a) Decrease	Secting a true hypothesis decreases when sample size is.
b) Increase	
c) Both of ther	m
d) None	
,	
	ollowing testing is concerned with making decisions using data?
a) Probability	
b) Hypothesis	
c) Causal	
d) None of the	mentioned
8. What is the pur	pose of multiple testing in statistical inference?
a) Minimize eri	<u> </u>
b) Minimize fa	lse positives
c) Minimize fal	

9. Normalized data are centred at and have units equal to standard deviations of the original data

a) 0

b) 5

c) 1

d) 10

Q10and Q15 are subjective answer type questions, Answer them in your own words briefly.

10. What Is Bayes' Theorem?

Answer - Bayes' theorem describes the probability of occurrence of an event related to any condition. It is also considered for the case of conditional probability. Bayes theorem is also known as the formula for the probability of "causes".

11. What is z-score?

Answer - A z score is simply defined as the number of standard deviation from the mean. The z-score can be calculated by subtracting mean by test value and dividing it by standard value.

$$z = (x - \mu)/\sigma$$

Where x is the test value, μ is the mean and σ is the standard value.

12. What is t-test?

Answer - A t-test is a statistical test that is used to compare the means of two groups. It is often used in hypothesis testing to determine whether a process or treatment actually has an effect on the population of interest, or whether two groups are different from one another.

13. What is percentile?

Answer - A percentile is a comparison score between a particular score and the scores of the rest of a group. It shows the percentage of scores that a particular score surpassed. For example, if you score 75 points on a test, and are ranked in the 85th percentile, it means that the score 75 is higher than 85% of the scores.

14. What is ANOVA?

Answer - Analysis of variance, or ANOVA, is a statistical method that separates observed variance data into different components to use for additional tests. A one-way ANOVA is used for three or more groups of data, to gain information about the relationship between the dependent and independent variables.

15. How can ANOVA help?

Answer - ANOVA tells you if there are any statistical differences between the means of three or more independent groups. ANOVA tests are a valuable tool in statistical analysis. ANOVA tests compare the difference between the means of two or more groups of data. ANOVA tests measure the degree to which levels or groups of an independent variable differ from each other.
